Paratracheal esophageal fistula was endoscopically repaired in a 6-month-old girl with esophageal atresia and tracheoesophageal fistula, in whom thoracotomy had been performed at the age of 2 months. The fistula site was located in the right posteriosuperior mediastinum. Endoscopically the fistula was divided endoscopically, and a purse-string suture was made at both ends of the divided fistula,

with the aid of a catheter. A silicone tube was passed through the fistula. The tube was brought out through the back of the neck and finally tied to the anterior trachea, and the anastomosis was endoscopically performed. The esophagus was repaired in the usual manner after the silicone tube was removed. One year after the operation the fistula had not recurred. Postoperative contrast radiography showed good patency of the silicone tube. Endoscopic repair of paratracheal esophageal fistula is simple, safe, and effective. A review of the antioxidant functions of human milk. The oxidation of proteins, lipids, and DNA in the human gastrointestinal tract results in the generation of reactive oxygen species (ROS), which are very reactive, leading to cellular damage, if not neutralized by antioxidants. The antioxidant content of human milk is very high, and can be ascribed to both the presence of antioxidants in the milk and the fact that the breast milk is in close contact with the human gastrointestinal tract. Infant nutrition is a key factor in determining the antioxidant status of the body in later life. In infancy the antioxidant status is in part determined by the antioxidants in breast milk, but in later life it is determined by the dietary intake of antioxidants. In addition to the abundant antioxidants in human milk, a proportion of antioxidant nutrients also appear to be transferred from the mother to the breast-fed infant during lactation, and these may also protect the infant against oxidative damage. This review summarizes the different aspects of the antioxidant functions of human milk and discusses its potential role in protecting against oxidative damage in the human gastrointestinal tract.
